can this run forever:
```
# unmount HDD - try to kill all processes first #3114
echo "# Killing the processes using /mnt/hdd"
processesUsingDisk=$(sudo lsof -t "/mnt/hdd")
if [ -n "$processesUsingDisk" ]; then
  while read -r pid; do
    processName=$(ps -p $pid -o comm=)
    echo "# Stop $processName with: 'kill -SIGTERM $pid'"
    sudo kill -SIGTERM $pid # Send SIGTERM signal
    sleep 5                 # Wait for the process to terminate
  done <<< "$processesUsingDisk"
fi
```

The script you've shared is designed to unmount a hard disk drive (HDD) by first trying to kill all processes that are using it. It will not run indefinitely under normal circumstances. Here's a breakdown of how it operates:

1. `processesUsingDisk=$(sudo lsof -t "/mnt/hdd")` : This command lists all the process IDs (PIDs) that are using the `/mnt/hdd` mount point. If there are no processes using the HDD, the variable `processesUsingDisk` will be empty.
2. `if [ -n "$processesUsingDisk" ]; then` : This checks if the `processesUsingDisk` variable is non-empty. If there are no processes using the HDD, the script will skip the while loop and proceed to unmount the HDD.
3. `while read -r pid; do ... done <<< "$processesUsingDisk"` : This is a while loop that reads each PID from `processesUsingDisk` . For each PID:
   - `processName=$(ps -p $pid -o comm=)` : Retrieves the name of the process.
   - `sudo kill -SIGTERM $pid` : Sends the SIGTERM signal to the process, asking it to terminate.
   - `sleep 5` : Waits for 5 seconds after sending the signal.
4. The loop continues until all PIDs in `processesUsingDisk` have been processed.

The script will terminate once all the processes using `/mnt/hdd` have been sent the SIGTERM signal. However, a few scenarios could potentially cause the script to take a long time or even appear to run indefinitely:

- **New processes starting**: If new processes start using `/mnt/hdd` while the script is running, they will not be included in the initial `processesUsingDisk` list and therefore will not be terminated by this script.
- **Processes not terminating**: If any processes do not terminate after receiving the SIGTERM signal, the script will continue to the next process but the unresponsive process will continue running.
- **Large number of processes**: If there are a very large number of processes to terminate, the script will take longer to complete.

To truly ensure that the script doesn't run indefinitely, you might want to add additional logic, such as a maximum number of iterations for the loop, or checks to ensure that processes have actually terminated.
