I have a pull request on github. I've moved quite a few files around. Github is showing them as deleted and created, vs simply moved. Can I manually create the lineage?

GitHub generally tries to automatically detect when files are moved or renamed, and it shows them as such in the pull request. However, if the contents of the files are significantly changed during the move, GitHub might fail to recognize that the files were moved and instead display them as deleted and then recreated.

Here are a few things you can try to improve GitHub's detection of file moves:

- 1. Separate commits:** When moving or renaming files, make sure to commit these changes separately from any edits you make to the file contents. This can help GitHub better recognize the action as a move or rename.
- 2. Manual hints in the pull request description:** While you can't directly alter how GitHub processes the detection in the pull request UI, you can clarify what has happened in the pull request description. Explain that specific files were moved rather than deleted and recreated, so reviewers are aware of the intended actions.
- 3. Command-line moves:** If you haven't completed the pull request yet, consider using the `git mv` command to move files. This command explicitly tells Git that you are moving a file, rather than deleting and recreating it. Even so, substantial changes to the file contents could still lead Git to view them as deletions and creations.
- 4. Recreate the commits:** If the pull request has not yet been merged and it's crucial for the move to be recognized correctly, you might consider recreating the commits. Here's how you can do it:

- Checkout a new branch from the main branch.
- Use `git mv` to rename or move the files, and make a commit.
- Apply the changes you made to these files in a separate commit.
- Push the new branch and create a new pull request.

Unfortunately, there is no way to manually adjust the file lineage in the GitHub interface after the fact. The system relies on its own algorithms to detect these changes based on the commits you push.
