Write a script to upload an image to AWS S3 using the Elixir programming language

Sure! Here's an example script to upload an image to AWS S3 using the Elixir programming language and the `ex_aws` library:

elixir

```
defmodule S3Uploader do
  @moduledoc """
  A module for uploading images to AWS S3.
  """

  def upload_image(bucket, file_path, key) do
    {:ok, credentials} = ExAws.Credentials.from_env()

    # Configure ExAws with your AWS credentials
    ExAws.Config.put_credential_provider(:default, credentials)

    # Configure ExAws with your desired AWS region
```

≡ ChatGPT 5.2 ▾

```
    {:ok, binary} = File.read(file_path)

    {:ok, _} = ExAws.S3.upload(bucket, key, binary)

    IO.puts "Image uploaded successfully!"
  end
end
```

To use this script, you'll need to add the `ex_aws` dependency to your `mix.exs` file:

elixir

 Copy code

```
defp deps do
  [
    {:ex_aws, "~> 2.1"},
    {:hackney, "~> 1.15"},
    {:poison, "~> 4.0"}
  ]
end
```

Then, run `mix deps.get` to fetch the dependencies.

To upload an image, you can call the `upload_image/3` function from the `S3Uploader` module, providing the bucket name, file path, and key as arguments:

elixir

 Copy code

```
S3Uploader.upload_image("your-bucket-name", "/path/to/image.jpg", "images/
```

Make sure to replace `"your-bucket-name"` with the actual name of your S3 bucket, `"/path/to/image.jpg"` with the path to the image file you want to upload, and `"images/my-image.jpg"` with the desired key under which the image will be stored in the S3 bucket.

Note: Ensure that you have set up the necessary AWS credentials in your environment variables or other appropriate credential provider methods supported by `ex_aws`.
