give me a proper name for this object, ask me questions for context:

If this object represents the current string from the card number text field (not complete, but while user is typing), that has to be validated, maybe consider a different name.

```
public class PrimerCardState: NSObject {  
    public let cardNumber: String  
  
    init(cardNumber: String) {  
        self.cardNumber = cardNumber  
    }  
}
```

It seems you are looking for a more descriptive name for the `PrimerCardState` class that encapsulates the state of the card number input as it's being typed. Given that the class is intended to represent the state of a card number that may be incomplete and requires validation, it would be beneficial to choose a name that reflects its dynamic and intermediary nature.

Here are a few questions that might help refine the context and lead to an appropriate name:

1. Is the class specifically designed to only hold the card number state, or might it be extended to include other states related to the card in the future?
2. Does the class perform validation on its own, or is it just a data container?
3. Is this class part of a larger framework or library where naming conventions should be followed?
4. Should the name indicate that the card number is incomplete or in the process of being entered?

Based on the purpose of the class as currently described, a name like

`CardNumberInputState` or `CardNumberEntryState` could be more descriptive. These

names indicate that the class is related to the input state of the card number field. If validation is also a key aspect of this class's responsibility, you might consider a name like `CardNumberValidationState`.

Would any of these suggestions fit the intended use of your class, or is there more specific functionality that should be captured in the name?

1. only state
2. just a container
3. yes
4. good idea

Given the answers to the questions, here are some naming suggestions for the class that reflect its role as a container for the card number input state, adhere to naming conventions, and suggest the card number may be in a state of entry or incomplete:

- `CardNumberInputState`
- `CardNumberDraft`
- `IncompleteCardNumberState`
- `CardNumberTypingState`
- `CardNumberEntryState`
- `PartialCardNumberState`

These names convey that the object is in a state of flux, containing a card number that is not yet final and possibly undergoing validation or completion. If there's a naming convention in the framework or library that this class is part of, it would be ideal to align with that.

Would any of these names suit your requirements, or do you have a preference for a particular naming style or convention?
