On android, the app icon I have is appearing edge to edge in some devices and in some devices it has a white border

This difference can occur due to the way different Android devices, or versions of Android, handle app icons. Android 8.0 (API level 26) introduced adaptive icons, which can display a variety of shapes across different device models. However, if an app doesn't provide an adaptive icon, or if the device is running an Android version that doesn't support them, it might add a white background to make the icon match other icons.

To make sure your icon appears consistently across all devices, you can use Android Studio's Image Asset Studio to create adaptive icons. It allows you to create different foreground and background layers for your icon, which the system then uses to create an adaptive icon.

Here's a brief guide:

1. Right-click the `res` folder and select `New > Image Asset`.
2. On the "Asset Type" dropdown, select `Adaptive` and `Legacy`.
3. Click on the `Foreground Layer` or `Background Layer` tabs to upload or design your icon.
4. Preview how your icon looks with different shapes and in different sizes, and adjust your design if necessary.
5. Click `Next > Finish`.

Remember, the key to a good adaptive icon is simplicity. Complex designs may not look good in small sizes or with certain shapes. The Android documentation offers more guidance on designing adaptive icons.

I can't find the option

My apologies for any confusion. Here's a more detailed step-by-step guide on how to access the Image Asset Studio:

1. Open your Android Studio project.
2. In the Project window, select the Android view.
3. Expand the 'app' node under your project.
4. Right-click on the 'res' folder.
5. In the context menu that appears, navigate to `New > Image Asset` .

If you're unable to find it, make sure that you're using an up-to-date version of Android Studio. It's also possible that your project view is set to something other than 'Android' in the Project window.

If you're still having trouble, please provide more detail about your specific situation.

How do I upload the logo?

In the Image Asset Studio in Android Studio, you can upload your own images for your logo as follows:

1. Open Image Asset Studio by following the steps I mentioned earlier (Right-click on the `res` folder, then go to `New > Image Asset`).
2. Under "Icon Type," make sure `Launcher Icons (Adaptive & Legacy)` is selected.
3. In the "Asset Type" dropdown, choose `Image` .
4. Next to "Path," there's a small folder icon. Click it to open a file dialog.
5. Navigate to where your image is saved on your computer, select it, and click `OK` .
6. The studio will now use your image as the basis for the icon. You can adjust the scaling and positioning of your image under the "Scaling" section.
7. Once you're happy with how it looks, click `Next` , and then `Finish` .

This will automatically generate all the necessary icons and place them in your `res/mipmap` folders.

What is the background layer?

In the context of adaptive icons for Android, the background layer is one of two layers that make up an adaptive icon. It serves as a backdrop for the icon's foreground layer.

The adaptive icon is composed of two layers:

1. **Foreground layer:** This contains the main visual elements of your icon, which could be your logo or main symbol. This layer is often visually more complex.
2. **Background layer:** This is the bottom layer, and it sits behind the foreground. It typically features a solid color, gradient, or simple design, providing a backdrop against which the foreground layer stands out.

When creating adaptive icons in Android, you can specify separate images or designs for both the foreground and background layers. Android will then animate these two layers independently when the user interacts with the icon.

For example, in Image Asset Studio in Android Studio, you can select an image or clip art for the foreground and pick a color for the background. Or, you can select separate images for both layers.
