on mac M1, what's the location of the brew binary?

The `brew` binary on a Mac M1 is typically located at `/opt/homebrew/bin/brew`.

```
/bin/bash -c "$(curl -fsSL
https://raw.githubusercontent.com/Homebrew/install/master/install.sh)"
```

what if you install it like this

If you install Homebrew using that script on a Mac M1, it still installs to `/opt/homebrew/bin/brew`. This installation method doesn't change the default installation location for M1 Macs.

what about

```
arch -x86_64 /bin/bash -c "$(curl -fsSL
https://raw.githubusercontent.com/Homebrew/install/master/install.sh)"
```

Using `arch -x86_64` to install Homebrew forces the installation to use the Intel architecture on an M1 Mac. In this case, Homebrew installs to the default location for Intel-based Macs, which is `/usr/local/bin/brew`.
