I am creating an app. I want the app to have a feature where users can create posts. I want to be able to display the posts as Cards, sort of giving a preview of the post. And when the user clicks on the card, it should show the entire post. Can you write me code that creates that card? Feel free to utilize @MUI components.

The post card should have:

- a title
- a body
- A button to view post

Certainly! Below is an example code using Material-UI components in React to create a post card with a title, body, and a button to view the entire post:

jsx

 Copy code

```
import React from 'react';
import { Card, CardContent, Typography, Button } from '@mui/material';

const PostCard = ({ title, body, onViewPost }) => {
  return (
    <Card variant="outlined" style={{ margin: '10px', maxWidth: '400px' }}>
      <CardContent>
        <Typography variant="h5" component="h2" gutterBottom>
          {title}
        </Typography>
        <Typography variant="body1" color="textSecondary" component="p">
          {body.length > 100 ? `${body.substring(0, 100)}...` : body}
        </Typography>
        <Button variant="contained" color="primary" onClick={onViewPost} size="small">
          View Post
        </Button>
      </CardContent>
    </Card>
  );
};
```

```
export default PostCard;
```

You can use this `PostCard` component in your app by passing the necessary props (`title`, `body`, and an `onViewPost` function) to display different posts. When the "View Post" button is clicked, it will execute the `onViewPost` function which should show the entire post. You can define this function where you use the `PostCard` component in your app.
