convert this method to sha-256 encryption

```
public static string EncryptPassword(string userName)
{
    using MD5 md5Hash = MD5.Create();
    byte[] data =
md5Hash.ComputeHash(Encoding.UTF8.GetBytes(userName));
    StringBuilder sBuilder = new StringBuilder();
    for (int i = 0; i < data.Length; i++)
    {
        sBuilder.Append(data[i].ToString("x2"));
    }
    return sBuilder.ToString();
}
```

To convert the provided method to SHA-256 encryption, you can use the `SHA256` class instead of `MD5`. Here's the modified method using SHA-256 encryption:

csharp

 Copy code

```
using System;
using System.Security.Cryptography;
using System.Text;

public static class PasswordEncryption
{
    public static string EncryptPassword(string userName)
    {
        using (SHA256 sha256Hash = SHA256.Create())
        {
            byte[] data = sha256Hash.ComputeHash(Encoding.UTF8.GetBytes(userName));
            StringBuilder sBuilder = new StringBuilder();
            for (int i = 0; i < data.Length; i++)
            {
                sBuilder.Append(data[i].ToString("x2"));
            }
        }
    }
}
```

```
    }  
    return sBuilder.ToString();  
}  
}  
}
```

This method now uses SHA-256 to hash the input string `userName` and returns the hashed value as a hexadecimal string.
