What is the correct aria-role for this svg which acts as a pointer?

svelte

```
<svg
  on:mousemove={(e) => {
    coords.set({ x: e.clientX, y: e.clientY })
  }}
  on:mousedown={() => size.set(30)}
  on:mouseup={() => size.set(10)}
>
  <circle
    cx={$coords.x}
    cy={$coords.y}
    r={$size}
  />
</svg>
```

In the context of your Svelte code, the `<svg>` element you're using to create a pointer isn't necessarily an interactive component with an ARIA role by itself. ARIA roles are typically used to provide information to screen readers about the role or purpose of an element, especially when the default semantics of the element may not be sufficient.

In your case, the SVG is acting as a pointer, and you want to make it accessible. You should consider adding an ARIA role to the `<circle>` element inside the SVG to provide additional information to assistive technologies. You can use the `role` attribute on the `<circle>` element to indicate its role as a pointer.

Here's an example of how you can add the `role` attribute to the `<circle>` element:

svelte

 Copy code

```
<svg
  on:mousemove={(e) => {
    coords.set({ x: e.clientX, y: e.clientY });
  }}
  on:mousedown={() => size.set(30)}
  on:mouseup={() => size.set(10)}
>
  <circle
    cx={$coords.x}
    cy={$coords.y}
    r={$size}
    role="pointer"
  />
</svg>
```

```
on:mousedown={() => size.set(30)}  
on:mouseup={() => size.set(10)}  
  
>  
  <circle  
    cx={$coords.x}  
    cy={$coords.y}  
    r={$size}  
    role="button" <!-- or "link", "image", or an appropriate role -->  
  />  
</svg>
```

In this example, I've used the "button" role as an example because it behaves like an interactive element, but you can choose an appropriate role based on the purpose of your pointer. The "link" role might also be suitable if the pointer represents a link or an action.

Remember to choose the ARIA role that best describes the functionality of your SVG element to enhance its accessibility for users of assistive technologies.

Should I not add a role to the svg itself, since it has mouse events?

Here's an A11y warning I get A11y: <svg> with mousemove, mousedown, mouseup handlers must have an ARIA role

You're correct. If your <svg> element contains interactive elements with mouse events, it's a good practice to assign an appropriate ARIA role to the <svg> element itself. This helps convey the interactive nature of the entire SVG container to assistive technologies.

In your case, you are using the <svg> element as a pointer with mouse events. You can add an ARIA role such as "button" or "link" to indicate that it has interactive functionality. Here's how you can do it:

svelte

 Copy code

```

<svg
  role="button" <!-- or "link", or another appropriate role -->
  on:mousemove={(e) => {
    coords.set({ x: e.clientX, y: e.clientY });
  }}
  on:mousedown={() => size.set(30)}
  on:mouseup={() => size.set(10)}
>
  <circle
    cx={$coords.x}
    cy={$coords.y}
    r={$size}
  />
</svg>

```

By adding the ARIA role to the `<svg>` element, you address the accessibility warning and provide more context to assistive technologies about the interactive behavior of the SVG container. The specific role you choose ("button," "link," etc.) should match the functionality and purpose of the SVG in your application.

i don't think button is the correct role

You are correct; "button" may not be the most suitable ARIA role for an SVG pointer. The choice of the ARIA role should accurately represent the functionality and purpose of the element.

If the SVG is acting as a pointer or cursor, you might consider using the "none" role or "presentation" role. These roles indicate that the element does not have an inherent role or should be ignored by assistive technologies. This is appropriate when the SVG is primarily a visual indicator and doesn't have a direct, interactive role. Here's an example using the "none" role:

svelte

 Copy code

```

<svg
  role="none"

```

```

on:mousemove={(e) => {
  coords.set({ x: e.clientX, y: e.clientY });
}}
on:mousedown={() => size.set(30)}
on:mouseup={() => size.set(10)}
>
<circle
  cx={$coords.x}
  cy={$coords.y}
  r={$size}
/>
</svg>

```

Using "none" or "presentation" indicates that the SVG doesn't have a direct interactive role and should be ignored by assistive technologies when conveying roles to users.

Are there any aria-roles that might be better suited?

For an SVG that acts as a pointer or cursor, it may be more appropriate to use the "img" role with a suitable `alt` text, as it indicates an image. The `alt` text should provide a concise and meaningful description of the SVG's purpose. Here's an example:

svelte

 Copy code

```

<svg
  role="img"
  aria-label="Pointer" <!-- Provide a meaningful description -->
  on:mousemove={(e) => {
    coords.set({ x: e.clientX, y: e.clientY });
  }}
  on:mousedown={() => size.set(30)}
  on:mouseup={() => size.set(10)}
>
<circle
  cx={$coords.x}
  cy={$coords.y}
  r={$size}

```

```
    />  
  </svg>
```

In this example, the `aria-label` attribute provides a description of the SVG's purpose. You should replace "Pointer" with a concise description that accurately represents the SVG's role in your application.

Using the "img" role with a meaningful `aria-label` provides a clear indication of the SVG's purpose without implying interactivity. It's a suitable choice when you want to convey the visual information without introducing interactive semantics.

please list the 10 most likely aria-roles that can be used here

Certainly, here are ten ARIA roles that could potentially be used for an SVG element like the one in your code, depending on its purpose and functionality:

1. `img` : If the SVG is a non-interactive image or visual indicator.
2. `presentation` : If the SVG is purely decorative and doesn't convey meaningful content or functionality.
3. `none` : Similar to `presentation` , used when the SVG doesn't have a direct role for assistive technologies.
4. `button` : If the SVG element is interactive and behaves like a button, triggering an action.
5. `link` : If the SVG represents a link or can be clicked to navigate to another location.
6. `menuitem` : If the SVG is used as a menu item or part of a menu.
7. `checkbox` : If the SVG represents a checkbox for selecting options.
8. `radio` : If the SVG represents a radio button for selecting a single option from a group.
9. `slider` : If the SVG acts as a slider for selecting a value within a range.
10. `tooltip` : If the SVG element provides additional information or tooltips.

The choice of the appropriate ARIA role should be based on the specific purpose and
