Hello can you give me a regex to match ULID format ?

Certainly! The following regular expression can be used to match the ULID (Universally Unique Lexicographically Sortable Identifier) format:

regex

 Copy code

```
^[0-9A-HJKMNP-TV-Z]{26}$
```

Explanation:

- `^` asserts the start of the string.
- `[0-9A-HJKMNP-TV-Z]` matches any character in the range 0-9, A-H, J-K, M-N, P-T, or V-Z.
- `{26}` specifies that the preceding character class should occur exactly 26 times (the length of a ULID).
- `$` asserts the end of the string.

Note that ULIDs are case-sensitive and use a modified base32 encoding, excluding the characters I, L, O, and Q to avoid confusion with numerals.

This one is correct ? `[0-7][0-9A-HJKMNP-TV-Z]{25}`

Apologies for the confusion. The regular expression you provided, `[0-7][0-9A-HJKMNP-TV-Z]{25}`, does not match the correct ULID format. ULIDs consist of 26 characters, where the first character is a time-based component represented in base-32 and the remaining 25 characters are random components also represented in base-32.

The correct regular expression to match the ULID format is:

regex

 Copy code

```
^[0123456789ABCDEFGHJKMNPQRSTVWXYZ]{26}$
```

Explanation:

- `^` asserts the start of the string.
- `[0123456789ABCDEFGHJKLMNPQRSTUVWXYZ]` matches any character in the range 0-9, A-Z excluding I, L, O, and U.
- `{26}` specifies that the preceding character class should occur exactly 26 times (the length of a ULID).
- `$` asserts the end of the string.

Again, please note that ULIDs are case-sensitive and exclude the characters I, L, O, and U from the character set.
