Edit String List UI

PR Link: <https://github.com/seamapi/seam-cli/pull/68>

Conversation Link: <https://chat.openai.com/share/82aa4e7b-43c4-4279-bb33-a347d85e4216>

How can i use npm prompts to allow a user to edit a string list, requirements:

- * look really good
- * allow adding items
- * allow removing items
- * display the full list set after each addition/deletion

To create a user interface in Node.js using `npm prompts` that allows users to edit a string list, you can follow these steps:

1. **Install Prompts Package**: First, ensure you have the `prompts` package installed. You can install it via npm:

Code

```
npm install prompts
```

2. **Set Up Your Script**: Create a script file (e.g., `editList.js`) and import the `prompts` module.

3. **Design the Interface**: Use `prompts` to create an interactive interface. You need to design it to:

- Display the current list.
- Allow adding items.
- Allow removing items.
- Display the updated list after each addition or deletion.

4. **Implement the Logic**: Implement the logic for each operation (add, remove, display).

Here is an example implementation:

Code

```
const prompts = require('prompts');

async function editList() {
  let list = [];

  while (true) {
    console.log('Current List:', list.join(', '));

    const response = await prompts({
      type: 'select',
      name: 'action',
      message: 'What do you want to do?',
      choices: [
        { title: 'Add Item', value: 'add' },
        { title: 'Remove Item', value: 'remove' },
        { title: 'Exit', value: 'exit' }
      ],
    });

    if (response.action === 'add') {
      const newItem = await prompts({
        type: 'text',
        name: 'item',
        message: 'Enter item to add:',
      });
      list.push(newItem.item);
    } else if (response.action === 'remove') {
      const removeItem = await prompts({
        type: 'select',
        name: 'item',
        message: 'Select item to remove:',
        choices: list.map((item, index) => ({ title: item, value: index })),
      });
      list.splice(removeItem.item, 1);
    } else if (response.action === 'exit') {
      break;
    }
  }

  console.log('Final List:', list.join(', '));
}

editList();
```

This script allows users to add and remove items from a list. After each operation, it displays the updated list. The user can exit the loop by choosing the 'Exit' option. The UI appearance depends on the terminal or console used and `prompts` inherently supports a good-looking, minimalist design.

Remember, you can always modify and style the prompts further to suit your specific requirements and aesthetics.
