Python Script for Curl Command

PR Link: <https://github.com/meta-llama/llama-recipes/pull/279>

Conversation Link: <https://chat.openai.com/share/d289e3f8-9d84-4eea-b4d0-fafd752150c9>

write a python script that implements the curl command below:

```
curl http://localhost:5000/generate -d '{
  "prompt": "Who wrote the book Innovators dilemma?",
  "max_tokens": 300,
  "temperature": 0
}'
```

You can implement the equivalent of the `curl` command in Python using the `requests` library. Here's a Python script that performs the same POST request to the specified URL with the provided JSON data:

Code

```
import requests

# Define the URL and payload
url = "http://localhost:5000/generate"
data = {
    "prompt": "Who wrote the book Innovators dilemma?",
    "max_tokens": 300,
    "temperature": 0
}

# Send the POST request
response = requests.post(url, json=data)

# Check the response status code
if response.status_code == 200:
    # Print the response content
    print(response.text)
else:
    print(f"Request failed with status code {response.status_code}")
```

Make sure you have the `requests` library installed in your Python environment. You can install it using `pip` if you don't already have it:

Code

```
pip install requests
```

Replace the `url` and `data` variables with your specific URL and JSON data if needed. This script sends a POST request to the specified URL with the JSON payload and prints the response content to the console.
