@Entity
@Builder
@Getter
@NoArgsConstructor(access = AccessLevel.PROTECTED)
@AllArgsConstructor
public class Terms extends BaseEntity {
    @Id
    @GeneratedValue(strategy =
GenerationType.IDENTITY)
    private Long termsId;

    private String title;
    private String body;

    @Enumerated(EnumType.STRING)
    private Optional optional;
}
public enum Optional {
    ESSENTIAL, OPTIONAL
}
Optional 말고 더 좋은 이름 없을까? enum 필드 값도 더 좋은 이
름 없을까?

```

It looks like you're designing a Java class named `Terms` with an associated enumeration to represent certain attributes of the terms. The current name for your enum, `Optional`, may not be ideal since it's a common keyword in Java and might lead to confusion. Here are some suggestions for renaming the enum and its values to better reflect their purpose:

1. Enum Name Suggestions:

- `TermsType`
- `TermsCategory`
- `TermsStatus`
- `TermsImportance`

2. Enum Value Suggestions:

- For `ESSENTIAL` :

- MANDATORY
- REQUIRED
- CRITICAL
- For OPTIONAL :
 - NONMANDATORY
 - ELECTIVE
 - FLEXIBLE

By choosing a more descriptive name for the enum and its values, you can make your code more readable and avoid potential misunderstandings. For example, `TermsType` with values `MANDATORY` and `ELECTIVE` clearly conveys the nature of the terms without overlapping with common Java keywords.

entity 이름은 Terms 가 좋은 것 같아, Term 가 좋은 것 같아?

Choosing between "Terms" and "Term" for your entity name depends on the specific use case and the data it represents. Here are some considerations for each:

1. Terms:

- Use "Terms" if your entity represents a collection or a set of conditions, guidelines, or stipulations, like in a contract or agreement.
- It implies the entity is a grouping of multiple items or points.

2. Term:

- Use "Term" if your entity represents a single condition, guideline, or stipulation.
- It is singular and suggests that each instance of the entity stands for one specific item or point.

So, if your entity is meant to encapsulate a single condition or point (e.g., a single clause in a contract), "Term" would be more appropriate. If it represents a set of such conditions or a complete agreement, "Terms" would be a better choice.

In the context of typical software applications, "Term" is often used for singular elements and "Terms" for collections or more complex structures. If your entity is intended to be a

part of a larger agreement or set, "Terms" might indeed be the better choice, as you initially thought.
