how do i check in golang whether the jwt token is still valid. take into account the current timezone might be different from the one in which the token was generated

In Go, you can use a library like github.com/dgrijalva/jwt-go to parse and validate JWT tokens. Here's a general approach to validating a JWT token, including checking its expiration time:

1. Parse the token string to get a token object.
2. Extract claims from the token and assert them into the expected format (e.g., `jwt.MapClaims`).
3. Check if the token is expired by looking at the `exp` claim.

Here is an example code to illustrate the steps above:

go

 Copy code

```
package main

import (
    "fmt"
    "time"

    "github.com/dgrijalva/jwt-go"
)

func main() {
    myToken := "your-jwt-token-here"

    // Parse the token
    token, err := jwt.Parse(myToken, func(token *jwt.Token) (interface{}, error) {
        // Don't forget to validate the alg is what you expect:
        if _, ok := token.Method.(*jwt.SigningMethodHMAC); !ok {
            return nil, fmt.Errorf("Unexpected signing method: %v", token.Method)
        }
        return []byte("your-secret"), nil
    })
}
```

```

if err != nil {
    fmt.Println("Error while parsing the token:", err)
    return
}

if claims, ok := token.Claims.(jwt.MapClaims); ok && token.Valid {
    // Convert the Unix timestamp from the token to time.Time
    if exp, ok := claims["exp"].(float64); ok {
        // Convert the float64 to an int64
        expTime := time.Unix(int64(exp), 0)
        currTime := time.Now()

        if currTime.After(expTime) {
            fmt.Println("Token is expired")
        } else {
            fmt.Println("Token is still valid")
        }
    } else {
        fmt.Println("Unable to find or convert expiration time")
    }
} else {
    fmt.Println("Token is not valid")
}
}

```

Make sure to replace "your-jwt-token-here" with your actual JWT token and "your-secret" with the actual secret key used to sign the JWT token.

Note that JWT expiry is generally represented as a Unix timestamp, so it's an absolute point in time, and time zones should not impact the validity check.

Please ensure you have this library installed using:

```
sh
```

 Copy code

```
go get github.com/dgrijalva/jwt-go
```

Note: As of my last knowledge update in January 2022, this library might not be well-maintained. You should look for alternative libraries or forks that are currently maintained and up-to-date with security best practices. Always ensure to use well-maintained libraries to avoid security vulnerabilities.
