is there a way how to show a spinner on react on every page

Yes, you can create a spinner or loading indicator in a React application to show loading state on every page. One common approach is to use a global state management solution, such as React Context or Redux, to manage the loading state across the entire application. Here's a basic example using React Context:

1. Create a context for managing the loading state:

jsx

 Copy code

```
// LoadingContext.js
import React, { createContext, useState, useContext } from 'react';

const LoadingContext = createContext();

export const LoadingProvider = ({ children }) => {
  const [isLoading, setIsLoading] = useState(false);

  const startLoading = () => {
    setIsLoading(true);
  };

  const stopLoading = () => {
    setIsLoading(false);
  };

  return (
    <LoadingContext.Provider value={{ isLoading, startLoading, stopLoading }}>
      {children}
    </LoadingContext.Provider>
  );
};

export const useLoading = () => {
```

```
    return useContext>LoadingContext);  
  };  
};
```

2. Wrap your entire application with the LoadingProvider :

jsx

 Copy code

```
// App.js  
import React from 'react';  
import { LoadingProvider } from './LoadingContext';  
import Routes from './Routes';  
  
const App = () => {  
  return (  
    <LoadingProvider>  
      <Routes />  
    </LoadingProvider>  
  );  
};  
  
export default App;
```

3. Use the loading context in your components:

jsx

 Copy code

```
// YourComponent.js  
import React, { useEffect } from 'react';  
import { useLoading } from './LoadingContext';  
  
const YourComponent = () => {  
  const { startLoading, stopLoading } = useLoading();  
  
  useEffect(() => {  
    // Simulate an asynchronous operation (e.g., API call)  
    startLoading();  
    setTimeout(() => {  
      // Your actual logic here  
      stopLoading();  
    }, 2000);  
  }, [startLoading, stopLoading]);  
};
```

```
    return (  
      <div>  
        { /* Your component content */ }  
      </div>  
    );  
  };  
  
  export default YourComponent;
```

4. Create a Spinner component:

You can create a reusable Spinner component that you can use in different parts of your application. You can find many pre-built spinner components or create a simple one using CSS.

jsx

 Copy code

```
// Spinner.js  
import React from 'react';  
  
const Spinner = () => {  
  return (  
    <div className="spinner">  
      { /* Your spinner content (e.g., loading animation) */ }  
      Loading...  
    </div>  
  );  
};  
  
export default Spinner;
```

Now, whenever you want to indicate a loading state in your components, you can use the `useLoading` hook to access the loading context and show the spinner accordingly.
