I'd like to make a github actions that automatically tag 'hacktoberfest' to all issues.

GitHub Actions allows you to automate various workflows, including interacting with issues in your repository. To create a GitHub Action that automatically adds a 'hacktoberfest' label to all issues, you'll need to follow these general steps:

Prerequisites:

- A GitHub repository that you have admin access to.
- A label named 'hacktoberfest' already created in your repository.

Step-by-step Implementation:**1. Setup GitHub Action Workflow**

Create a new workflow file in your GitHub repository under `.github/workflows/`. For instance, `.github/workflows/autolabel.yml` with the following content to get started:

yaml

 Copy code

```
name: Auto Label Hacktoberfest

on:
  issues:
    types: [opened]

jobs:
  auto-label:
    runs-on: ubuntu-latest
    steps:
      - name: Label issues
        uses: actions/github-script@v5
        with:
          script: |
            github.rest.issues.addLabels({
              owner: context.repo.owner,
              repo: context.repo.repo,
```

```
    issue_number: context.issue.number,  
    labels: ['hacktoberfest']  
  })  
  github-token: ${{secrets.GITHUB_TOKEN}}
```

2. Explanation of the Workflow File:

- `on: issues: types: [opened]` : This workflow will run when an issue is opened.
- `runs-on: ubuntu-latest` : The workflow will run on the latest version of Ubuntu available in GitHub Actions.
- `uses: actions/github-script@v5` : This uses the `github-script` action, which allows you to interact with the GitHub API using JavaScript.
- The `script` part is written in JavaScript and calls the `addLabels` API method to add labels to an issue. `context.issue.number` is used to get the issue number of the issue that triggered the workflow.
- `github-token: ${{secrets.GITHUB_TOKEN}}` : GitHub provides a `GITHUB_TOKEN` secret that you can use to authenticate in your workflow.

3. Commit and Push

Commit the workflow file and push it to your GitHub repository. Once pushed, GitHub Actions will start running the workflow for the subsequent issues that will be opened.

Note:

- Ensure that the 'hacktoberfest' label exists in your repository, if it doesn't exist, create it. If issues are labeled that doesn't exist, the API call to add labels might fail.
- Make sure to test the workflow with a test issue to ensure that it's working as expected.
- Be cautious with automated labeling to avoid any unintended spammy behavior and always adhere to the [GitHub Actions usage policies](#).

Now, whenever an issue is opened in your repository, the GitHub Action will automatically add the 'hacktoberfest' label to it. If you want to extend functionality or conditions for labeling, you might adjust the JavaScript code in the `script` section of the workflow.
