how can I use goimport-reviser with vscode instead of goimports

`goimport-reviser` is a tool for formatting Go imports, similar to `goimports`, but with additional features like grouping and sorting imports. To use `goimport-reviser` with Visual Studio Code (VS Code) instead of `goimports`, you'll need to configure your VS Code settings to use `goimport-reviser` for formatting your Go code. Here's a step-by-step guide on how to do this:

### Step 1: Install `goimport-reviser`

First, you need to install `goimport-reviser` if you haven't already. You can do this by running the following command:

```
bash
```

[Copy code](#)

```
go get -u github.com/incu6us/goimports-reviser/v2
```

### Step 2: Configure VS Code Settings

- 1. Open VS Code Settings:** Open the Command Palette in VS Code (use `ctrl+Shift+P` on Windows/Linux or `cmd+Shift+P` on macOS), then type `Preferences: Open Settings (JSON)` and select it. This will open your `settings.json` file.
- 2. Update Go Formatting Tool:** In the `settings.json` file, you need to specify `goimport-reviser` as the formatting tool. Add or modify the following lines:

```
json
```

[Copy code](#)

```
{
  "go.formatTool": "goimports-reviser",
  "go.alternateTools": {
    "goimports": "goimports-reviser"
  },
  "[go]": {
    "editor.formatOnSave": true,
    "editor.codeActionsOnSave": {
      "source.organizeImports": true
    }
  }
}
```

```
    },  
    },  
  },  
}
```

- `"go.formatTool": "goimports-reviser"` tells VS Code to use `goimport-reviser` for formatting.
- `"go.alternateTools": {"goimports": "goimports-reviser"}` ensures that when VS Code tries to use `goimports`, it will use `goimport-reviser` instead.
- The `[go]` settings ensure that your Go code is formatted on save and imports are organized.

**3. Save the Settings File:** After making these changes, save the `settings.json` file.

### Step 3: Test the Configuration

To test the configuration, open a Go file in VS Code and try editing and saving it. The `goimport-reviser` should automatically format your code and organize imports when you save the file.

### Additional Notes

- Ensure that `goimport-reviser` is installed in a location that is in your system's PATH, so VS Code can access it.
- You may need to restart VS Code for the changes to take effect.
- If you encounter any issues, double-check the paths and settings, and make sure that `goimport-reviser` is correctly installed and accessible from the command line.

This should set up `goimport-reviser` as your default import formatting tool in VS Code for Go development.

Will this enable me to also use `gofumpt`

Using both `goimport-reviser` and `gofumpt` in Visual Studio Code (VS Code) for Go development involves a bit more configuration, as they serve slightly different purposes. `goimport-reviser` is used for organizing imports, while `gofumpt` is a stricter format tool that enforces a more opinionated style than `gofmt`.

To use them together in VS Code, you'll need to configure your environment to run `gofumpt` for formatting your Go code, and `goimport-reviser` for organizing imports. Here's how to do it:

## Step 1: Install `gofumpt` and `goimport-reviser`

First, ensure you have both tools installed:

- Install `gofumpt` :

```
bash
```

[Copy code](#)

```
go get -u mvdan.cc/gofumpt
```

- Install `goimport-reviser` :

```
bash
```

[Copy code](#)

```
go get -u github.com/incu6us/goimports-reviser/v2
```

## Step 2: Configure VS Code Settings

1. **Open VS Code Settings:** Open the Command Palette ( `ctrl+Shift+P` on Windows/Linux, `cmd+Shift+P` on macOS) and type `Preferences: Open Settings (JSON)` .
2. **Update the Configuration:** In the `settings.json` file, add or modify the following lines:

```
json
```

[Copy code](#)

```
{
  "go.formatTool": "gofumpt",
  "go.alternateTools": {
    "goimports": "goimports-reviser"
  },
  "[go]": {
    "editor.formatOnSave": true,
    "editor.codeActionsOnSave": {
      "source.organizeImports": true
    }
  },
}
```

In this configuration:

- `"go.formatTool": "gofumpt"` sets `gofumpt` as the default formatting tool.
- `"go.alternateTools": {"goimports": "goimports-reviser"}` ensures that `goimport-reviser` is used for organizing imports.
- The `[go]` settings activate format on save and organize imports.

**3. Save the Settings File:** After making these changes, save the `settings.json` file.

### Step 3: Test the Configuration

Open a Go file and edit it. When you save the file ( `ctrl+s` or `cmd+s` ), VS Code should format the code using `gofumpt` and organize the imports using `goimport-reviser` .

### Additional Notes

- Ensure that both `gofumpt` and `goimport-reviser` are installed in locations included in your system's `PATH`.
- You may need to restart VS Code for the changes to take effect.
- If you encounter any issues, verify the installation paths and settings, and ensure that both tools are accessible from the command line.

This setup will allow you to use `gofumpt` for code formatting and `goimport-reviser` for import organization in your Go projects within VS Code.
