

Report conversation

i have git branch
i make mistake when run git pull origin master
because
other team member make

git reset --hard
eb03ab7090faa328380cfd82552fa67c42eac00a
git push --force origin master

now i have wrong commits
how to rebase my commits after master
eb03ab7090faa328380cfd82552fa67c42eac00a?

To rebase your commits after the eb03ab7090faa328380cfd82552fa67c42eac00a commit on the master branch, you can follow these steps:

1. Make sure you have the latest changes from the remote repository by running:

```
sql
```

[Copy code](#)

```
git fetch origin
```

2. Switch to your branch where you have the wrong commits:

```
php-template
```

[Copy code](#)

```
git checkout <your-branch>
```

3. Start the interactive rebase:

```
bash
```

[Copy code](#)

```
git rebase -i origin/master
```

4. An editor will open with a list of commits. Locate the commit you want to edit, which should be the first commit after the eb03ab7090faa328380cfd82552fa67c42eac00a commit. Change the word "pick" to "edit" for that commit.
5. Save and close the editor.

6. Git will now start the rebase process and pause at the commit you marked for editing. You can now modify or remove the changes in that commit as needed.
7. After making the necessary changes, stage them:

bash

 Copy code

```
git add <file1> <file2> ... # Stage the modified files
git rm <file3> <file4> ... # Remove any files you want to delete
```

8. Amend the commit with your changes:

sql

 Copy code

```
git commit --amend
```

9. Git will prompt you to modify the commit message. Save and close the editor.
10. Continue the rebase process:

kotlin

 Copy code

```
git rebase --continue
```

11. Git will apply the remaining commits after your edited commit.
12. Once the rebase is complete, you can push the changes to the remote repository using the `--force` option if necessary:

css

 Copy code

```
git push --force origin <your-branch>
```

Please note that force-pushing can be disruptive, especially if other team members have already based their work on the previous state of your branch. Make sure to communicate with your team and consider the implications before using the `--force` option.
