Please do this in a more elegant way:

```
σp.reshape(-1, σp.shape[-1])).reshape(σp.shape[:-1])
```

σp is a numpy-like array

Certainly, you can achieve the same reshaping operation in a more elegant way by using the `reshape` method directly on the `σp` array without the need for double reshaping. Here's the more concise code:

python

 Copy code

```
σp = σp.reshape(σp.shape[:-1])
```

This code reshapes the `σp` array into the desired shape directly, making it more elegant and efficient.
