According to Morgan Law, are those 2 C# lines equivalent ?

```
if (visual.Opacity != 0 && visual.IsVisible)
if (visual is { Opacity: 0 } or { IsVisible: false })
```

No, these two lines of C# code are not equivalent according to Morgan's Laws.

Morgan's Laws are a set of transformation rules that apply to logical expressions. They state that:

1. The negation of a conjunction is the disjunction of the negations.
2. The negation of a disjunction is the conjunction of the negations.

In plain English, this means that "not (A and B)" is the same as "(not A) or (not B)", and "not (A or B)" is the same as "(not A) and (not B)".

The first line of your code says "if the visual's opacity is not zero AND the visual is visible".

The second line of your code says "if the visual's opacity is zero OR the visual is not visible".

So, these two lines are not equivalent. The first line will only be true if both conditions are met (the opacity is not zero and the visual is visible), while the second line will be true if either of the conditions is met (the opacity is zero or the visual is not visible).

If you wanted to use Morgan's Laws to create an equivalent statement to the first line, it would look something like this:

```
if (!(visual is { Opacity: 0 } or { IsVisible: false }))
```

This says "if it is not the case that the visual's opacity is zero or the visual is not visible", which is equivalent to "if the visual's opacity is not zero and the visual is visible".
