Give example of standard way of deprecating method in TypeScript

Sure, deprecating a method in TypeScript involves marking it as deprecated using a JSDoc comment with `@deprecated` tag. Here's an example:

typescript

 Copy code

```
class MyClass {  
    /**  
     * @deprecated This method is deprecated. Use myNewMethod instead.  
     */  
    oldMethod() {  
        // Deprecated method implementation  
    }  
  
    myNewMethod() {  
        // New method implementation  
    }  
}  
  
const obj = new MyClass();  
  
// Using the deprecated method  
obj.oldMethod(); // This will generate a warning in most IDEs and linting tools
```

In this example, the `oldMethod()` is marked as deprecated using the `@deprecated` JSDoc comment. When developers use this method, they will receive a warning indicating that it's deprecated and should be replaced with `myNewMethod()`.
