## javascript read a json file in nodejs using await

In Node.js, you can read a JSON file using the `fs` (File System) module and `util` module for promisifying functions. If you want to use `await` with the `fs` module, you can use the `promises` API introduced in Node.js version 10.0. Here's how you can do it:

First, make sure you have the `fs` and `util` modules installed. If you don't have them installed, you can install them using npm or yarn:

```
bash
```

[Copy code](#)

```
npm install util
```

Now, you can create an async function to read a JSON file using `await`. Here's an example:

```
javascript
```

[Copy code](#)

```
const fs = require('fs').promises; // Using fs.promises for asynchronous f.
const util = require('util');

// Async function to read a JSON file
async function readJsonFile(filePath) {
  try {
    // Read the file using fs.promises.readFile and await for the result
    const data = await fs.readFile(filePath, 'utf8');

    // Parse the JSON data
    const jsonData = JSON.parse(data);

    // Return the parsed JSON object
    return jsonData;
  } catch (error) {
    // Handle errors, e.g., file not found
    throw new Error('Error reading JSON file: ' + error.message);
  }
}
```

```
}
```

```
// Example usage
```

```
async function main() {  
  const filePath = 'path/to/your/file.json'; // Specify the path to your JSON file  
  try {  
    // Call the async function and wait for the result  
    const jsonContent = await readJsonFile(filePath);  
  
    // Use the JSON content as needed  
    console.log(jsonContent);  
  } catch (error) {  
    console.error(error.message);  
  }  
}
```

```
// Call the main function to start the process  
main();
```

In this code, the `readJsonFile` function reads the JSON file asynchronously and returns the parsed JSON object. The `main` function is an example of how you can use the `readJsonFile` function. When you run this script, it will read the specified JSON file and log its content. Remember to replace `'path/to/your/file.json'` with the actual file path you want to read.
